

# EHRs: Friend or Foe?

Sarah Pacini, JD

Chief Executive Officer

Cooperative of American Physicians, Inc.

# Disclosures

## CAP Education / CME Committee

**No faculty, planner or presenter for this CME activity disclosed any relevant financial relationship with a commercial interest.**

# Objectives

*At the end of this program the attendee will be able to:*

- ✓ Discuss specific documentation and user errors that jeopardize patient safety.
- ✓ Discuss guidelines for documentation that address system and user factors and how to prevent each.
- ✓ Identify current and evolving risk in electronic medical record documentation
- ✓ Discuss the issues most often seen in professional liability lawsuits.

GOALS

# Technology and Healthcare

“It is widely believed that, when designed and used appropriately, health IT can help create an ecosystem of safer care...”

-Institute of Medicine, *Health IT and Patient Safety:  
Building Safer Systems for Better Care*

# Crico Strategies – EHR Study

## Crico EHR Study – Health IT 2012-2013

- 248 Closed Cases
  - Ambulatory Care – 146
  - Inpatient 77
  - ED 25

## User and System-Related Factors

# EHR-Related System and User Issues

  
248 Cases

58% System Related Issues	63% User Related Issues
System and software design	User errors- MISC
Routing of electronic data	Hybrid Health Records- conversion issues
System dysfunction or malfunction	Incorrect Information
Integration problems/incompatible systems	COPY and Paste
Failure of alert-alarm-DSS	Training and education
Fragmented Information	All other

# Cases – Contributing Factors

## System-Related Cases

A pathology report of adenocarcinoma was delayed in reaching a pts. chart until after discharge. Also, no alert was sent to the PCP re: abnormal findings.

A PCP could not access the pts. radiology studies in the EHR at the time of a pts. visit. Also, the paper report was filed without MD seeing it. Resulting in a delay dx CA.

## User-Related Cases

A physician received an alert that the patient was allergic to amoxicillin but ordered it anyway, resulting in an allergic reaction.

A patient developed amiodarone toxicity because the pts. history and medication list were copied from a previous note. Noting the patient was already on the medication resulting in overdose.

# EHR Related Allegations

# Medication Related Cases

<b>PCP e-refilled levothyroxine. Another medication Glipizide was also refilled (which was another patient's medication). Pt. took both and three weeks later was hospitalized.</b>	<b>Pt. brought to ED unresponsive with a Blood Sugar of 22. Admitted and was in vegetative state.</b>	<b>Conversion to e scribe, records merged during conversion.</b>
<b>Long time patient was prescribed and excessive dose Primadone. Usual dose 750mg or 2.250g/day. Instead received 3g/day.</b>	<b>Pt. got up at night, fell and sustained a fractured wrist.</b>	<b>Office was transitioning to EHR and e prescribing.</b>
<b>Pt. received an Rx for Augmentin and experienced an adverse reaction and went to the ED.</b>	<b>The EHR notes an allergy RED alert for Augmentin.</b>	<b>Phys. Inexperienced with EHR.</b>

# User Related Issues

- Specific User-Related Issues Presented Through Case Examination
  - Copy & Paste – Also known as ‘Cut & Paste’
  - Templates and Dropdowns
  - Alert Fatigue
  - Conversion Issues – Paper to EHR
  - Education and Training

# Copy & Paste – Cut & Paste

The information provided may be used for personal use only. Any other use requires prior permission of the PIAA.

# Copy & Paste

- ✓ Results in “Note Bloat”
- ✓ Propagates errors
- ✓ Raises questions about authorship, provenance
- ✓ Stifles thoughtful reflection, creativity and critical analysis
- ✓ Undermines Integrity of Record and Provider Credibility

Study

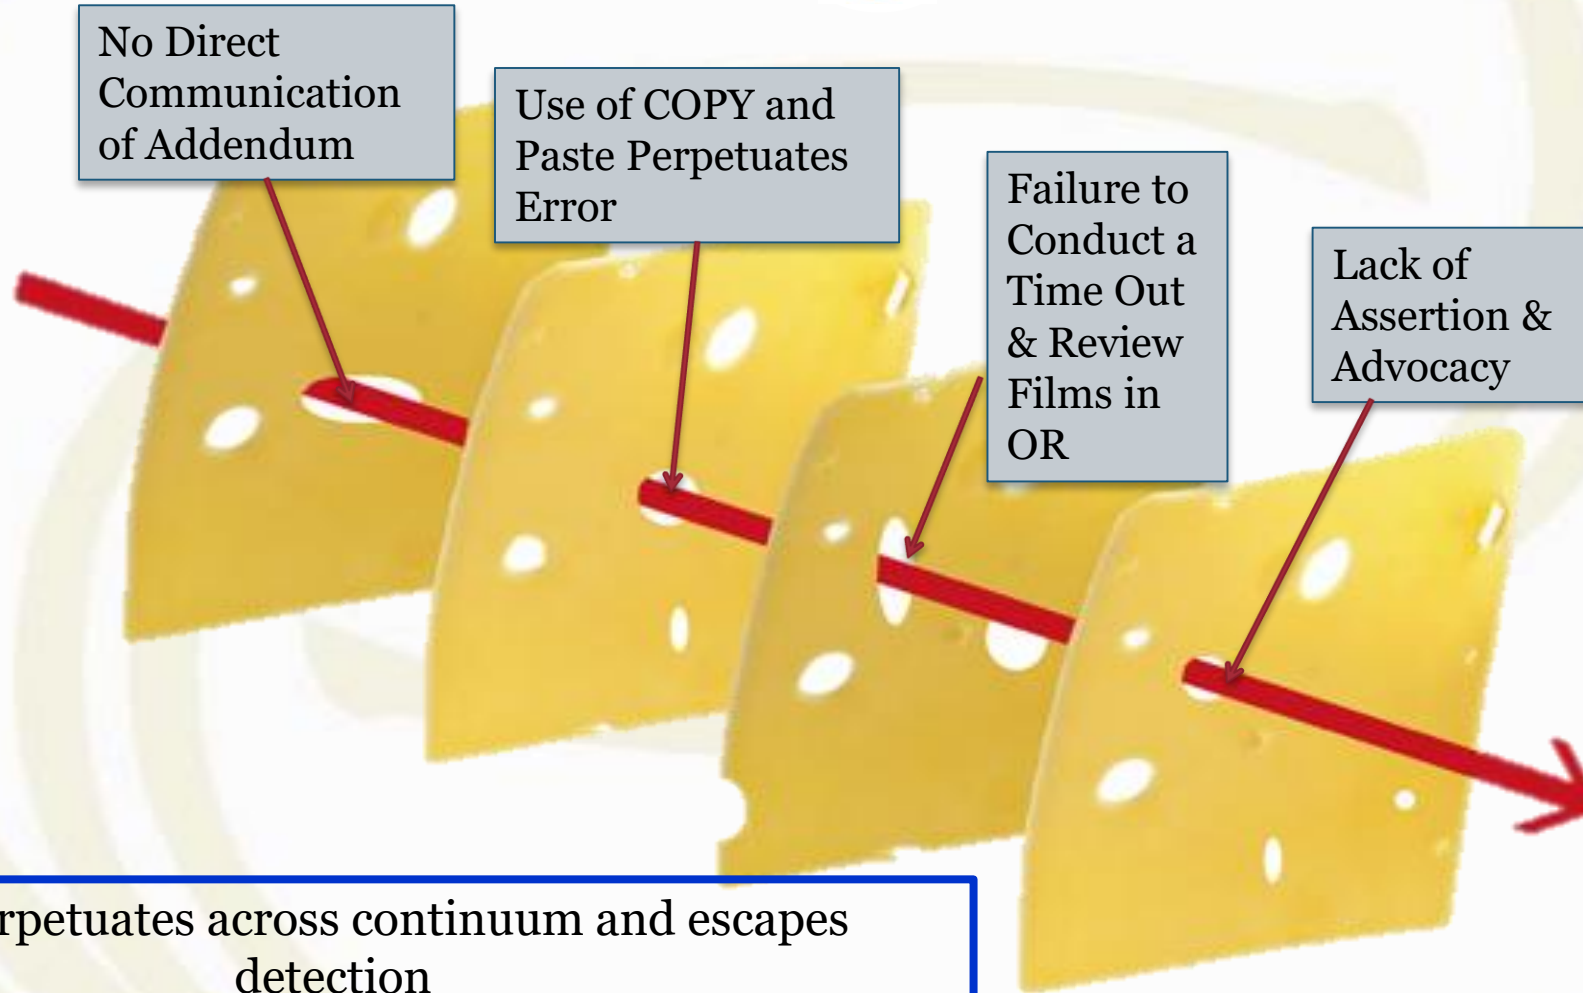

# Copy & Paste

## CASE STUDY: SUMMARY OF FACTS

Summary	Allegations	Injury
<ul style="list-style-type: none"><li>• CP Pt presents to ER with hematuria urologist orders CT</li><li>• Radiologist notes “mass on left kidney” later addends report to reflect “right” kidney</li><li>• Urologist <b>copies and pastes</b> incorrect information into note</li><li>• Surgeon <b>copies and pastes</b> urologists note</li><li>• No Time Out or Films in the OR</li><li>• Incorrect Kidney removed</li></ul>	<ul style="list-style-type: none"><li>• Improper performance</li><li>• Battery</li><li>• Lack of Informed Consent</li></ul>	<ul style="list-style-type: none"><li>• Removal of healthy kidney.</li><li>• Post-Procedure dialysis</li><li>• Kidney Transplantation</li></ul> 

# Root Causes & Systems Failures

# Settlement: Trust Limits

## California Medical Board Investigation

- **Gross Negligence:** failed to review the pt's radiographic images prior to performing a nephrectomy and on the day of surgery
- **Repeated Negligent Acts:** failed to obtain and personally review the radiographic images or a report of those images; instead, cloned the notes without updating them or ensuring accuracy
- **Failure to Maintain Adequate and Accurate Records:** fraudulent (because the surgeon even copied the part of the urologists note indicating that he had seen the patient in the ER...)

## California Medical Board Disciplinary Order

- Physician's and Surgeon's certificate is revoked. However, the revocation is stayed and the physician is placed on probation for three (3) years on the following terms:
- Wrong-Site Surgery Course: Within 60 days of the effective date of the decision, physician shall enroll in a Wrong-Site Surgery Course.
- Medical Record Keeping Course: Within 60 days of the effective date of the decision, physician shall enroll in a Medical Record Keeping Course.
- Notification: Within seven (7) days of effective dated a true copy of the Decision and Accusation must be presented to every hospital where privileges or membership is maintained.
- Supervision of Physician Assistants: During the probation, the physician is prohibited from supervision physician assistants.

# Just How Big is the Problem?

- 167,000 computerized records, found physical exams were copied **in their entirety** in 3% of charts.
- 2,000 progress notes for 135 patients in ICU  
**82% of notes had 20% or more copied text**

*U.S. Department of Veterans Affairs*

*Critical Care Medicine Feb, 2013*

# Copy and Paste

## CASE STUDY: SUMMARY OF FACTS

- |   |   |  |
|---|---|--|
| <ul style="list-style-type: none"><li>• 78-year old man who “with an alleged history of ‘PE’ (interpreted by the clinicians as pulmonary embolism) received an unnecessary CT scan to rule out a suspected ‘recurrence’ of pulmonary embolus.</li></ul> | <ul style="list-style-type: none"><li>• Earlier in the medical record the abbreviation ‘PE’ had been used in the electronic note to indicate that the patient had a physical examination. Not a pulmonary embolism.</li></ul> | <ul style="list-style-type: none"><li>• This is a vividly example of how “Copy and Paste” can promulgate a mistake that will live on in the EHR forever.</li></ul> |
|---|---|--|

# Copy & Paste Risk Strategies

- Avoid copying and pasting of text from another person's note without attribution, as that is plagiarism and may constitute billing fraud.
- Avoid repetitive copying and pasting of laboratory results and radiology reports.
- Note important results with proper context, and document any resulting actions. Avoid wholesale inclusion of information readily available elsewhere in the EHR because that creates clutter and may adversely affect note readability.
- Review and update as appropriate any shared information found elsewhere in the electronic record (e.g., problems, allergies, medications) that is included in a note.
- Include previous history critical to longitudinal care in the outpatient setting, as long as it is always reviewed and updated. Copying and pasting other elements of the history, physical examination or formulations is risky, as errors in editing may jeopardize the credibility of the entire note.

# Template Temptation & Dropdown Dilemma

# Template Temptation

- Auto-populate feature can populate inaccurately or before events being documented occur
- Documentation must reflect what was actually done
- Should tell a story– the patient should come into focus
- Too generic, not intuitive to use

Case  
Study

# Templates & Drop Downs

## CASE STUDY: SUMMARY OF FACTS

Summary	Allegation	Injury
<ul style="list-style-type: none"><li>• 33 year old male seen by MD 33 times over 33 months.</li><li>• Complaints of low back pain.</li><li>• MD prescribed Norco, Oxycontin, Roxicodone and eventually Valium and Ativan.</li><li>• MD referred pt to pain management specialist who continued medications and early refill pattern and added Fentanyl patch.</li><li>• One month after last visit, pt. found unresponsive and died.</li></ul>	<ul style="list-style-type: none"><li>• Documentation of office visits was completely unchanged, template-like entries.</li><li>• Failure to update assessment of the patient.</li></ul>	<ul style="list-style-type: none"><li>• One month after last visit, pt. found unresponsive and ultimately died.</li><li>• Autopsy poly-drug intoxication.</li></ul>

# Settlement

- **California Medical Board Disciplinary Order:**
  - Controlled Substances – Maintain records & access to records & inventories (Detailed Order)
  - Complete a Prescribing Practices Course.
  - Complete a Medical Record Keeping Course.
  - Complete a Professionalism Program (Ethics Course).
  - Complete a Clinical Training Program.
  - Submit within 30 days a proper individual for monitoring the practice/billing
  - During probation, physician is prohibited from practicing pain management

# Too Many Alerts, Too Little Time

U Mass Memorial  
Medical Center

Alarm sounded for 75 minutes, signaling need for battery replacement.

Battery died and when patient's heart failed, no alarm sounded.

Tobey Hospital in Wareham

A patient's EKG displayed a flat line for more than two hours secondary to a dead battery in the heart monitor. Nurses checked on the patient, but patient suffered a major heart attack and was found unresponsive. Investigation revealed nurse had unusually heavy patient load and needed help.

Elderly man suffered fatal heart attack while crisis alarm on cardiac monitor was turned off. Staff didn't respond to numerous lower-level alarms warning of low heart rate. 10 nurses on duty could not recall hearing alerts or seeing scrolling messages on 3 signs in the hallway

# Case Study

**Robert Wachter's Book**  
**"The Digital Doctor: Hope, Hype, and Harm at the Dawn of Medicine's Computer Age"**  
**Location: UCSF**

# Alert Fatigue

## CASE STUDY: SUMMARY OF FACTS @ UCSF

Summary		Injury
<ul style="list-style-type: none"><li>• 16 yr. old with rare genetic disease took prophylactic Septra 160mg BID</li><li>• Admit for colonoscopy. Resident wrote 1 double strength septra 160 mg.</li><li>• CPOE converted mg/kg and determined dose to be 38 ½ double strength pills.</li><li>• Resident only saw the 160 mg on the screen. Sent the order but received an immediate alert – it was disregarded.</li></ul>	<ul style="list-style-type: none"><li>• More alerts on the peds unit disregarded.</li><li>• Pharmacy busy. Pharmacist reviews, signs off because knows physician. Disregards alerts.</li><li>• Robot fills prescription, no one checked robot.</li><li>• 38 ½ pills placed in medication drawer.</li><li>• First year float nurse, thought it was odd but proceeded to administer.</li></ul>	<ul style="list-style-type: none"><li>• Experienced a grand mal seizure and coded.</li></ul>

Overdose

Error perpetuates across continuum and escapes detection

# Alert Fatigue

## Outcome

- Outcome unknown
- Suggested improvements:
  - Differentiate alert signals
  - Establish crisis alarms
  - Overriding should be a conscious decision
  - Beware of automation Bias!

A doctor, wearing a white lab coat over teal scrubs and a stethoscope, holds a small wooden-framed chalkboard. The chalkboard has the text "Legal Defense 101" written on it in white. The doctor's hands are visible holding the board from the sides.

Legal Defense 101

# Defense Challenges

- Reviewing records → discrepancy between printed record and what appears on computer screen. Difficult for MD to interpret printed record during deposition
- Late Entry → system logs actual time information is entered, may not reflect when procedure actually completed. How does one prove events happen at the time the witness says?
- Scanned and Shredded → Scanned copy of poor quality. Once original is destroyed no way to recover data. Could result in “spoliation argument”
- Plaintiff’s counsel argues → EHR features represent standard of care

# Be Mindful of Metadata

- “Data that describes other data”
- Reveals→
  - logon logoff times,
  - what was reviewed and for how long
  - changes and additions made and when
  - whether alerts/warnings were overridden
- E-discovery
- Could be beneficial to defense!

# Risk Reduction Strategies

- Use the system as intended, don't deviate, drift or get creative
- When in doubt → ASK!!
- Address overrides
- Question Authority—especially if it's a computer
- Attribute notes to author and review templates
- Educate the Patient
- Resist alteration

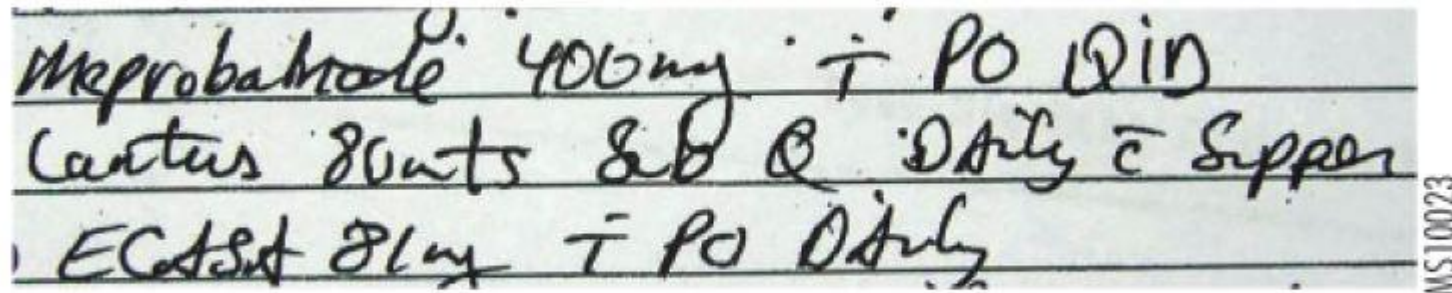

# Before EHRs

# Before EHR's

**Figure 3. Order Written for 8 Units of Lantus Insulin Misread as 80 Units**

Handwritten medical order on lined paper. The text is written in cursive and reads: "Meprabazole 400mg T PO BID", "Lantus 80 units BID Q Daily c Supper", and "ECASA 81mg T PO Daily". A vertical stamp "MST0023" is visible on the right side of the paper.
